CHOLESTEROL 
CHOD PAP
Liquid ready to use

Reagent for quantitative determination of Total Cholesterol in human serum or plasma

**TECHNICAL SUPPORT AND ORDERS**

Tel : (33) 03 23 25 15 50
Fax: (33) 03 23 256 256

**CLINICAL SIGNIFICANCE** (1) (2)

Total cholesterol assay, associated to assays of others lipids in serum are used in the diagnosis of hyperlipidemia. Increased levels are also seen in hepatic and thyroid disorders. Total cholesterol assay associated to triglycerides, HDL-Cholesterol and LDL-Cholesterol determination is useful in the prediction of coronary heart diseases. So this assay is used in the diagnosis and treatment of atherosclerotic diseases. Hypercholesterolemia can also be observed in certain cases of diabetes. Secondary disorders that elevate cholesterol levels, should be ruled prior to initiating therapy with cholesterol-lowering drugs.

**PRINCIPLE** (4)

Enzymatic method described by Allain and al., which reaction scheme is as follows:

\[
\text{Cholesterol esters} \xrightarrow{\text{CE}} \text{Cholesterol + free fatty acids}
\]

\[
\text{Cholesterol + O}_2 \xrightarrow{\text{CO}} \text{Cholesten 4 one 3 + H}_2\text{O}_2
\]

\[
2\text{H}_2\text{O}_2 + \text{Phenol + PAP} \xrightarrow{\text{POD}} \text{Quinoneimine (pink) + 4 H}_2\text{O}
\]

**REAGENTS COMPOSITION**

**Vial R1** WORKING REAGENT

<table>

**Vial R2** STANDARD

| Cholesterol 200 mg/dL (5.17 mmol/L) |

**SAFETY CAUTIONS**

BIOLABO reagents are designated for professional, in vitro diagnostic use.

- Verify the integrity of the contents before use.
- Use adequate protections (overall, gloves, glasses).
- Do not pipette by mouth.
- In case of contact with skin and eyes, thoroughly wash affected areas with plenty of water and seek medical advise.
- Reagents contain sodium azide (concentration < 0.1%) which may react with copper and lead plumbing. Flush with plenty of water when disposing.
- Material Safety Data Sheet is available upon request.
- Waste disposal: Respect legislation in force in the country.

**REAGENTS PREPARATION**

Reagents are ready for use.

**STABILITY AND STORAGE**

Store away from light, in well capped original vial and at 2-8°C.

- Standard (vial R2): Transfer the requested quantity, recap and store at 2-8°C.
- Unopened, reagents are stable until expiry date stated on the label of the kit when stored and used as described in the insert.
- Once opened, working reagent is stable until expiry date stated on the label of the kit when free from contamination.
- Discard any reagent if cloudy or if reagent blank at 500 nm is > 0.400.
- Don’t use working reagent after expiry date stated on the label of the Kit.

This kit should be refrigerated during transport.

**SPECIMEN COLLECTION AND HANDLING** (2)

**Serum or plasma** (Heparin or EDTA):

Do not use oxalate, fluoride or citrate. Collect on fasting patient. Separate serum from cells within 2 hours.

Cholesterol is stable in the specimen for:

- 5-7 days at 2-8°C
- 3 months at –20°C
- Many years at –70°C.
- Avoid repeated freezing and thawing.
INTERFERENCES (2) (3) (5)

- Ascorbic acid: Negative interference above 5 mg/dL.
- Haemoglobin: Positive interference above 33 mg/dL.
- Bilirubin: Negative interference above 8.6 mg/dL. Serum blank may increase this interference.
- Lipemia: Low interference limited by CE lipase activity.
- Enzymatic methods increase analytic specificity. CO also reacts with 3β-hydroxycholesterols (insignificant quantity in human serum – i.e., DHEA, pregnenolone).

For a more comprehensive review of factors affecting this assay refer to the publication of Young D.S or N.W. Tietz.

MATERIALS REQUIRED BUT NOT PROVIDED

1. Basic medical analysis laboratory equipment.
2. Normal and pathological control sera.

CALIBRATION (6)

- Kit standard (vial R2) or BIOLABO-Multicalibrator REF 95015 traceable to SRM 909b.
- Or any calibrator traceable to reference method or material.

The calibration frequency depends on proper instrument functions and on the preservation of the reagent.

It is recommended to calibrate in the following cases:
1. When changing vial of reagent.
2. After maintenance operations on the instrument.
3. When control values are out of range, even after using a new vial of fresh serum.

QUALITY CONTROL

- BIOLABO EXATROL-N Level I REF 95010.
- BIOLABO EXATROL-P Level II REF 95011.
- Other assayed control sera referring to the same method.
- External quality control program.

It is recommended to control in the following cases:
1. At least once a run.
2. At least once within 24 hours.
3. When changing vial of reagent.
4. Before maintenance operations on the instrument.

If control is out of range, apply following actions:
1. Repeat the test with the same control.
2. Repeat the test with a fresh control serum and compare the result.
3. If control is still out of range, a new vial of calibrator or a fresh control serum may help.

LINEARITY

The reaction is linear up to at least 500 mg/dL (12.9 mmol/L). Above, dilute the specimen with saline solution and reassay taking into account dilution factor. Linearity limit depends on specimen/reagent ratio.

MANUAL PROCEDURE

Let stand reagent and specimens at room temperature.

<table>
<thead>
<tr>
<th>Pipette into well identified test tubes:</th>
<th>Blank</th>
<th>Standard</th>
<th>Assay</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reagent</td>
<td>1 mL</td>
<td>1 mL</td>
<td>1 mL</td>
</tr>
<tr>
<td>Demineralised water</td>
<td>10 µL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Standard</td>
<td>10 µL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Specimen</td>
<td>10 µL</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Mix. Let stand for 5 minutes at 37°C or 10 minutes at room temperature. Record absorbances at 500 nm (480-520) against reagent blank. Colour is stable for 1 hour.

Note: Specific procedures are available upon request for automated instruments. Please contact BIOLABO technical support.

CALCULATION

Calculate the result as follows:

Result = \( \frac{\text{Abs (Assay)}}{\text{Abs (Standard)}} \times \text{Standard concentration} \)
